Floatables

The New York/New Jersey Harbor Complex was monitored for floatables five times from July 2 - July 7. The Harbor Complex was clear of significant floatable debris all five days.

Bacteria

On July 5, bacteriological samples were taken along the Long Island coast from Rockaway Point (LIC01) to Tiana Beach (LIC26). The Long Island samples were tested for fecal coliform (FC) and enterococcus bacteria. The remaining two Long Island beaches, and the New Jersey beaches were not sampled due to heavy sea fog and poor visibility.

On July 5, along the Long Island coast, the highest fecal coliform count, 156 FC/100ml, occurred at Tiana Beach (LIC26). The highest enterococcus count, 28 enterococci/100ml, occurred at Rockaway (LIC02).

All counts are below water quality standards.
